Alert Messaging System (AMS)
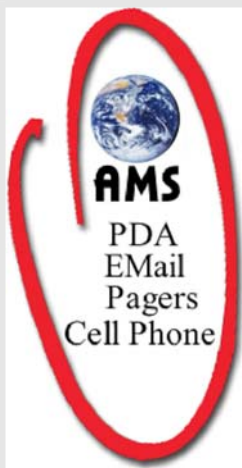

- **Are you prepared if an emergency strikes again? Remember Isabel?**
- **How will you keep your workforce informed?**
- **Can you get your staff the information they need?**
- **Can you communicate instantly with all your staff without risking your network?**

Imagine there's an emergency and you need to alert your staff immediately. You need to pass on important information, what to do and most importantly what not to do. Unfortunately, no business, big or small, is immune to the very real and tangible risks that can cause serious disruption. Whether those disruptions are natural disasters or man-made disasters, the true cost of unmanaged disasters can be too great to risk being unprepared. Your business must be ready to manage an emergency situation in a timely manner. If your business relies solely on email to communicate with employees, partners or clients, a disruption in an email system can render communication impossible. If on the other hand, your company relies on phone system to send alerts, then a disruption in phone system will be the breaking point of communication. These days, everyone has a cell phone. So you turn to cell phones to send alerts, but how can you call hundreds or even thousands of employees in a short period of time? If electricity goes out, even a simple loudspeaker cannot be used.

Relying on just one method of communication is risky and dangerous, and depending on the nature of disaster, deadly. The key to reliability is redundancy. The more method of communication at your disposal, the better. What if you had all of these methods of communication at your fingertips?

With the Alert Messaging System (AMS), that is exactly what you'll have. AMS provides you with email, cell phone, pager, PDA, and web communication all from a single source. You can configure the system to send instant messages using ALL of these methods to hundreds, even thousands of employees, clients, or partners with a touch of a button. If one method of communication fails, you have many others to choose from, all using different mechanisms to deliver the message, providing you the redundancy you want to achieve the reliability you need.

The AMS can be customized to meet your business needs and requirements. You can define custom messages that can be quickly selected by emergency management personnel without the need for any typing. When time is of the essence, every keystroke maters. You can further simplify the system by defining user groups that emergency management personnel can choose to send message to hundred or even thousands of employees. When a system is designed to be used in an emergency, it's critical to have a simple and user-friendly interface. AMS is just that.

Alert Messaging System (AMS) Advantages

- Instantly invoke AMS via a web-based Control Panel
- Send AMS alerts and other essential information to cell phones, pagers, PDAs, e-mails, and the Internet in matter of seconds
- Communicate with your partners, employees, vendors, and customers during a service disruption or other disasters

- Easily deploy AMS enterprise-wide in just few hours
- Reliable, robust, real-time communication
- Simple to use, no training required
- Safe and secure
- Effective emergency communication solution
- Single interface
